data

Properties of digital innovation

- Interdisciplinary
- Scalable
- Automating
- High speed

Data products are interdisciplinary artifacts

Zürcher Hochschule für Angewandte Wissenschaften

Business and technology need to connect for digital innovation to happen

Meierhofer, Stadelmann, & Cieliebak. "Data Products". In: Braschler et al. (Eds). "Applied Data Science – Lessons Learned for the Data-Driven Business", Springer, 2018 (to appear).

Project example: Complexity 4.0

Goal

 Reduce unnecessary complexity of product variability in production environments in a data-driven (~automatable) fashion

Project team

- Business partners: 2 different industries with large production facilities in CH
- **Economists**: ITEM-HSG (technology management, business models)
- Engineers: ZHAW-Engineering (machine learning), ZHAW-Life Sciences (simulation)

Results

- "The paradigm of data-driven decision support can [...] enter the domain of a highly qualified business consultant, delivering the quantitative results necessary to ponder informed management decisions."
- *"It is merely the knowledge* of what methods and technologies are possible and available **that** currently **hinders the faster adoption** of the data-driven paradigm in businesses."

Hollenstein, Lichtensteiger, Stadelmann, Amirian, Budde, Meierhofer, Füchslin, & Friedli *"Unsupervised Learning and Simulation for Complexity Management in Business Operations"*. In: Braschler et al. (Eds). "Applied Data Science – Lessons Learned for the Data-Driven Business", Springer, 2018 (to appear).

Observation

Interdisciplinarity & Innosuisse:

Properties of digital innovation

- Interdisciplinary ✓
- Scalable
- Automating
- High speed

Properties of digital innovation

- Interdisciplinary ✓
- Scalable
- Automating
- High speed

Automation at scale in a digitized world ...enabled by two key technologies

Increased automation depth due to advances in pattern recognition

CLOUD COMPUTING

No need for huge investments / large facilities to do big business

Cloud Service Models

ALPHAGO 00:10:29

AI

Project example: LIBRA Face matching for MLD4 compliance

Goal

 Check customers for MLD4 compliance prior to transaction by comparison of, inter alia, portrait pictures, with sanction lists

Approach

Larger architecture of machine learning models to prepare and perform robust face verification
and anti-spoofing

Detection & classification

Stadelmann, Amirian, Arabaci, Arnold, Duivesteijn, Elezi, Geiger, Lörwald, Meier, Rombach & Tuggener (2018). "Deep Learning in the Wild". ANNPR 2018.

Zürcher Hochschule

Project example: LIBRA Face matching for MLD4 compliance

Goal

Check customers for MLD4 compliance prior to transaction by comparison of, inter alia. portrait pictures, with sanction lists

Approach

Larger architecture of machine learning models to prepare and perform robust face verification and anti-spoofing ID

Project example: PANOPTES Newspaper article segmentation for print media monitoring

Goal

Automatically segment newspaper pages into constituting articles for automatic print media monitoring

Approach

Image-based approach with deep neural networks that learn layouting principles from examples

Meier, Stadelmann, Stampfli, Arnold, & Cieliebak. "Fully convolutional neural networks for newspaper article segmentation". ICDAR 2017.

Stadelmann, Tolkachev, Sick, Stampfli, & Dürr. "Beyond ImageNet - Deep Learning in Industrial Practice". In: Braschler et al. (Eds). "Applied Data Science – Lessons Learned for the Data-Driven Business", Springer, 2018 (to appear).

Observations

Size of idea \neq size of company

...SMEs can **build whatever they want** (given know-how and an interesting case)

...the **business model needs trust** (or rather the people behind it)

Technology is independent of specific industry

...enabling **new** collaborations and **alliances**

...increasing the **importance of networks** of partners

Properties of digital innovation

Previous observations

- Interdisciplinary \checkmark
- Scalable (√) Automating (√)
- High speed (\checkmark) no sequential innovation process

size of idea \neq size of company, independence of industry

Depth of innovation

Hypothesis 1: SMEs need access to networks Why? Interdisciplinarity, independence of industry, scalability

SMEs can build similar digital products than any larger enterprise ...but have less specialized knowledge and human resources at their disposal

Apply the existing	Recombine the existing	Create tech. prerequisites
Products on the market, know-how widely available (e.g. process support by IT)	Product or technology on market, know-how still novel (e.g. business model innovation through combination of hardware & service)	Base technology exists, case never implemented before, transferability possible (e.g. algorithms for automating pattern recognition tasks)
BUSINESS NEEDS: <i>purpose</i> Research: - Zürcher Fachhochschule	Research: transfer	Research: R&D

Zürcher Hochschule für Angewandte Wissenschaften

Hypothesis 2: basic & applied research converge Why? Speed of innovation, breakthrough driven by application

Business innovation funding needs to adapt to new turnover times and skill profiles ...applied R&D is more than transfer and needs to be grounded in scientific community

Zürcher Hochschule für Angewandte Wissenschafter

Hypothesis 3: crucial digital innovation needs be happen the level of society, not business

Conclusions

Support in digitalisation for SMEs can build on the following corner stones:

- Access to interdisciplinary teams and networks of experts with diverse skills
- Industry sector affiliation and size of business play a decreasing role
- If research is involved, then it is likely touching basic & applied research
 → needs environment to strive

Moreover:

• besides business, we as **society need specific support** to shape our digital future

APPENDIX

Swiss Alliance for Data-Intensive Services

zh

The Swiss Alliance for Data-Intensive Services provides a significant contribution to **make Switzerland** an internationally recognized hub for data-driven value creation.

In doing so, we rely on **cooperation in an interdisciplinary expert network** of innovative **companies** and **universities** to combine knowledge from different fields into marketable products and services.
